DOCTORAL SCHOOL COLLABORATION PROFIL

QUANTUM BIOLOGY & QUANTUM ARTIFICIAL INTELLIGENCE TOOLS FOR THE TARGET (4D) SPACE-TIME VISUALIZATION OF MAGNETIC RESONANCE IMAGING (MRI) BASED COMPUTER GRAPHICS CHALLENGING DESIGN

Dr. Mohamed SOLTANE (Associate Professor A) Ph.D & HDR leader for Doctoral schools Project research collaboration preparing to launch a collaborations with Research Professors between Research Laboratories @ The Following Universities, Research Centers & Research Units: [YFUM, USTHB, University of BLIDA, University of BOUMERDES, BADJI MOKHTAR UNIVERSITY OF ANNABA, CDTA, CERIST & LaMOS Research Unit @ Bejaïa].

The target DOCTORAL SCHOOL research project is in biomedical fields, that Combine Quantum Computing and Artificial Intelligence in modeling DNA-Chromosomes Mutations in Cancer Healing from the VR-Virtual Reality point of view,

QUANTUM BIOLOGY & QUANTUM ARTIFICIAL INTELLIGENCE TOOLS FOR THE TARGET (4D) SPACE-TIME VISUALIZATION OF MAGNETIC RESONANCE IMAGING (MRI) BASED COMPUTER GRAPHICS CHALLENGING DESIGN

The research hypotheses of the target DOCTORAL SCHOOLS are tumors that attack and destroy human being body tissues without long terms symptoms; Deciphering genetic code which translates DNA's information into proteins will be a challenging task in building Data Expertise; (4D) space-time visualization of Magnetic Resonance Imaging (MRI) based Computer Graphics are a Challenging Design and will be a target revolution in the system of visualization;

The target objective finding from that DOCTORAL SCHOOLS research Project should be at two-dimension levels:

1. The first level should be at a computer graphics simulation design, I would like that when the DOCTOR in Hospital suggests a medicine for a target patient, he should estimate the molecules damages at the cell level and could be predict and visualizing the rebuilding of the molecules rates in the beginning stages at the computer graphics simulation challenging.

2. The second level should be at the sensor level of the system of visualization of the MRI scanners technologies, ... I am thinking beyond the **Femto scale**, I am dreaming to see the systems of visualization could provide the visualization of the rebuilding body tissues at the level of DNA, cells and molecules...Combining Quantum Computing and Artificial Intelligence in modeling DNA-Chromosomes Mutations in Cancer Healing from VR-Virtual Reality VR-MODELING point of view.

Therefore :

In the context of GENE EDITING TO CURING DISEASE, one of the works as promising cornerstones for the upcoming DOCTORAL SCHOOLS research Project for DATA expertise. Are the achievements targets works performed by the Nobel laureates in chemistry 2020: Professor Jennifer A. Doudna @ University of California, Berkeley, USA and Professor Emmanuelle charpentier, chancellor @ the Max Planck Unit for the Science of PATHOGENS, MAX PLANCK INSTITUTE FOR INFECTION BIOLOGY IN BERLIN.

The collaboration between Jennifer Doudna's laboratory and Emmanuelle Charpentier's laboratory showed that Cas9 could be used to make cuts in any DNA sequence desired. The method they developed involved the combination of Cas9 with easily created synthetic "guide RNA" molecules. Synthetic guide RNA is a chimera of crRNA and tracrRNA; therefore, this discovery demonstrated that the CRISPR-Cas9 technology could be used to edit the genome with relative ease.

CRISPER-Cas9 (Clustered Regulatory Interspaced Short Palindromic Repeats), and Cas9 is a protein used as a molecular scissor in a precise way.

Emmanuelle Charpentier's investigated how the pathogen STREPTOCOCCUS PNEUMONIAE utilizes mobile genetic elements to alter its genome in different ways.

The target DOCTORAL SCHOOL research project is inspired from the achievements of the works done BY Eric Lander @ Broad Institute of MIT and Harvard, USA.

Eric Lander *is president and founding director of the Broad Institute of MIT and Harvard. A geneticist, molecular biologist, and mathematician, he has played a pioneering role in all aspects of the reading, understanding, and biomedical application of the human genome. He was a principal leader of the international Human Genome Project.*

He has done pioneering work on human genetic variation; human population history; genome evolution; regulatory elements; long non-coding RNAs; three-dimensional folding of the human genome; and genome-wide screens to discover the genes essential for biological processes using CRISPR-based genome editing.

THE TARGET OBJECTIVES are setup a mechanism of collaborations between research laboratories for the target DOCTORAL SCHOOL research project in biomedical fields, that Combine Quantum Computing and Artificial Intelligence in modeling DNA-Chromosomes Mutations in Cancer Healing from the VR-Virtual Reality point of view,
