Abstract

The concept of intuitionistic topological space was introduced by Coker .The aim of this paper is to discuss the relation between bitopological spaces and double-topological spaces and give a notion of pairwise compact for double topological spaces .

1-Introduction

The concept of a fuzzy topology introduced by Change[2], after the introduction of fuzzy sets by Zadeh . Later this concept was extended to intuitionistic fuzzy topological spaces by Coker in [4]. In [5] Coker studied continuity, connectedness, compactness and separation axioms in intuitionistic fuzzy topological spaces. In this paper, we follow the suggestion of J.G. Garcia and S.E. Rodabaugh [7] that (double fuzzy set) is more appropriate name than а (intuitionistic fuzzy set) ,and therefore adopt the term (double-set) for the intuitionistic set, and (double-topology) for the intuitionistic topology of Dogan Coker, (this issue), we denote by Dbl-Top the construct (concrete texture over set) whose objects are pairs (X, τ) where τ is a double-topology on X .In section three, we discuss making use of this relation between bitopological spaces and

double- topological spaces , we generalize a notion of compactness for doubletopological space in section four .

2-Preliminaries

Throughout the paper by X we denote a non-empty set . In this section we shall present various fundamental definitions and propositions. The following definition is obviously inspired by Atanassov [1].

2.1.Definition. [3] A double-set (DS in brief) A is an object having the form $A = <x, A_1, A_2 >$,

Where A_1 and A_2 are subsets of X satisfying $A_1 \cap A_2 = \phi$. The set A_1 is called the set of members of A, while A_2 is called the set of non-members of A.

throughout the remainder of this paper we use the simpler $A=(A_1,A_2)$ for a double-set.

2.2.Remark. Every subset A of X is may obviously be regarded as a double-set having the form $A = (A, A^c)$,

where $A^{c} = X - A$ is the complement of A in X.

we recall several relations and operations between DS's as follows:

2.3.Definition. [3] Let the DS's A and B on X be the form $A=(A_1,A_2)$,

B=(B₁, B₂), respectively . Furthermore, let $\{A_i : j \in J\}$ be an arbitrary family of DS's

- in X, where $A_{i} = (A_{i}^{(1)}, A_{i}^{(2)})$. Then
- (a) $A \subseteq B$ if and only if $A_1 \subseteq B_1$ and $A_2 \supseteq B_2$;
- (b) A = B if and only if $A \subseteq B$ and $B \subseteq A$;
- (c) $\overline{A} = (A_2, A_1)$ denotes the complement of A ;

(d)
$$\bigcap A_j = (\bigcap A_j^{(1)}, \bigcup A_j^{(2)});$$

(e)
$$\bigcup A_j = (\bigcup A_j^{(1)}, \bigcap A_j^{(2)});$$

(f) []
$$A = (A_1, A_1^c);$$

- (g) $\langle \rangle A = (A_2^c, A_2);$
- (h) $\phi = (\phi, X)$ and $X = (X, \phi)$.

In this paper we require the following :

(i) ()
$$A = (A_1, \phi)$$
 and) $(A = (\phi, A_2)$.

Now, we recall the image and preimage of DS's under a function.

2.4.Definition. [3,8] Let $x \in X$ be a fixed element in X. Then:

(a)The DS given by $x = (\{x\}, \{x\}^c)$ is called a double–point (DP in brief X).

(b)The DS $x = (\phi, \{x\}^c)$ is called a

vanishing double-point (VDP in brief X).

2.5.Definition. [3,8]

(a) Let x be a DP in X and A=(A₁,A₂) be a DS in X. Then $x \in A$ iff $x \in A_1$.

Let x be a VDP in X and A=(A₁,A₂) a DS in X. Then $x \in A$ iff $x \notin A_2$. It is clear that $x \in A \Leftrightarrow x \subseteq A$ and that $x \in A \Leftrightarrow x \subseteq \overline{A}$.

2.6.Definition. [5] A double-topology (DT in brief) on a set X is a family τ of DS's in X satisfying the following axioms :

T1:
$$\phi, X \in \tau$$
,

T2: $G_1 \cap G_2 \in \tau$, for any $G_1, G_2 \in \tau$,

T3: $\bigcup G_j \in \tau$, for any arbitrary family $\{G_i : j \in J\} \subseteq \tau$.

In this case the pair (X, τ) is called a double-topological space (DTS in brief), and any DS in τ is known as a double open set (DOS in brief). The complement \overline{A} of a DOS A in a DTS is called a double closed set (DCS in brief) in X.

2.7.Definition. [5] Let (X, τ) be an DTS and $A = (A_1, A_2)$ be a DS in X.

Then the interior and closure of A are defined by :

 $int(A) = \bigcup \{G : G \text{ is a DOS in } X \text{ and } G \subseteq A \},\$

 $cl(A) = \bigcap (H : H \text{ is a DCS in } X \text{ and } A \subseteq H \},$

respectively.

It is clear that cl(A) is a DCS in and int(A) a DOS in X. Moreover, A is a DCS in X iff cl(A) = A, and A is a DOS in X iff int (A) = A.

2.8. Example. [5] Any topological space (X, τ_0) gives rise to a DT of the form $\tau = \{A : A \in \tau_0\}$ by identifying a subset A in X with its counterpart A = (A , A^c), as in Remark 2.2.

3- The Constructs Dbl-Top and Bitop :

We begin recalling the following result which associates a bitopology with a double topology.

3.1.Proposition. [5] Let (X, τ) be a DTS.

(a) $\tau_1 = \{A_1 : \exists A_2 \subseteq X \text{ with } A = (A_1, A_2) \in \tau\}$ is a topology on X.

(b) $\tau_2^* = \{A_2 : \exists A_1 \subseteq X \text{ with } A = (A_1, A_2) \in \tau\}$ is the family of closed sets of the topology $\tau_2 = \{A_2^c : \exists A_1 \subseteq X \text{ with } A = (A_1, A_2) \in \tau\}$ on X.

(c) Using (a) and (b) we may conclude that (X, τ_1, τ_2) is a bitopological space.

3.2.Proposition. Let (X, u, v) be a bitopological space. Then the family

 $\{(U,V^c): U \in u, V \in v, U \subseteq V\}$

is a double topology on X.

Proof. The condition $U \subseteq V$ ensures that $U \cap V^c = \phi$, while the given family contains ϕ because $\phi \in u, v$, and it contains X because $X \in u, v$. Finally this family is closed under finite intersections and arbitrary unions by Definition 2.3 (d,e) and corresponding properties the the of topologies u and v.

3.3. Definition. Let (X, u, v) be a bitopological space. Then we set

$$\tau_{uv} = \{ (U, V^c) : U \in u, V \in v, U \subseteq V \}$$

and call this the double topology on X associated with (X, u, v).

3.4.Proposition. If (X, u, v) is a bitopological space and τ_{uv} the corresponding DT on X, then

 $(\tau_{uv})_1 = u \text{ and } (\tau_{uv})_2 = v.$

Proof. $U \in u$ implies $(U, \phi) \in \tau_{uv}$ since $U \subseteq X \in v$, so $u \subseteq (\tau_{uv})_1$. Conversely, take $U \in (\tau_{uv})_1$. Then $(U, B) \in \tau_{uv}$ for some $B \subseteq X$. Now $U \in u$, hence $(\tau_{uv})_1 \subseteq u$, and the first equality is proved.

The proof of the second equality may be obtained in a similar way, and we omit the details.

4- Piarwise Compact in Double- Topological Spaces .

In this section we define double compact set and we use the link between bitopological space and double topological space to established some theorems .

4.1. Definition. By an double open cover of a subset A of a double topological space $(X,\tau),$ we mean a collection $C = \{G_j : j \in J\}$ of double open subsets of Х such that $A \subset \bigcup \{G_j : j \in J\}$ then we say that C covers A. In particular, a collection C is said to be an open cover of the space X iff $X = \bigcup \{ (G_i^1, G_i^2) : j \in J \} \text{ of }$ double open subsets of X.

4.2.Definition. A double-set A of DTS in (X, τ) is said to be double compact set iff for every double open cover has double finite sub cover , that is iff for every collection $\{G_j : j \in J\}$ of DOS's for which

 $A \subset \bigcup \{G_j : j \in J\} \text{ for } A = (A_1, A_2) \text{ such}$ that $(A_1, A_2) \subset (G_{j1}^1, G_{j1}^2) \bigcup ... \bigcup (G_{jn}^1, G_{jn}^2).$

4.3.Definition. Let (X, τ) be double topological space and let Y be a double subset of X. The τ - double relative topology for Y is the collection τ_Y given by $\tau_Y = \{G \cap Y : G \in \tau\}$. The double topological space (Y, τ_Y) is called double subspace of (X, τ) .

4.4.Proposition. Let Y be a subspace of double topological spaces X and let $A \subset Y$, then A is double compact set relative to X iff A is double compact set relative to Y.

Proof : Let A be double compact set relative to X and let $\{V_i : j \in J\}$ be a collection of DS's, double open relative to Y . Which covers А so that $(A_1, A_2) \subset \{(V_i^1, V_i^2) : j \in J\}$ then there exists G_i double open set's relative to X such that $V_i = Y \cap G_i$, for every $j \in J$. It follows that $(A_1, A_2) \subset \{(G_i^1, G_i^2) : j \in J\}$ so that $\{G_i : j \in J\}$ is open cover of A relative to X. Since A is double compact set relative to X, there exist finitely many indices j_1, \dots, j_n such that

$$(A_1, A_2) \subset (G_{i1}^1, G_{i1}^2) \cup ... \cup (G_{in}^1, G_{in}^2)$$

Since $A \subset Y$ we have

$$(A_1, A_2) \subset Y \cap \{ (G_{j_1}^1, G_{j_1}^2) \bigcup ... \bigcup (G_{j_n}^1, G_{j_n}^2) \}$$
$$= (Y \cap (G_{j_1}^1, G_{j_1}^2)) \bigcup ... \bigcup (Y \cap (G_{j_n}^1, G_{j_n}^2))$$

Since $Y \cap G_{ii} = V_{ii}$ (*i* = 1,2,...,*n*) we

obtain $(A_1, A_2) \subset (V_{j1}^1, V_{j1}^2) \cup ... \cup (V_{jn}^1, V_{jn}^2)$

this shows that A is double compact set relative to Y.

Conversely, let A be double compact set relative to Y and let $\{G_j : j \in J\}$ a collection of DOS's of X which cover A, so that $(A_1, A_2) \subset \{(G_j^1, G_j^2) : j \in J\} \dots (1)$

Hence $A \subset Y$,(1) implies that $A \subset Y \cap [\bigcup \{ (G_j^1, G_j^2) : j \in J \}] =$

 $\bigcup \{Y \cap (G_j^1, G_j^2) : j \in J\}$, hence

 $Y \cap (G_j^1, G_j^2)$ is double open relative to Y, the collection $\{Y \cap G_j : j \in J\}$ is double open cover of A relative to Y. Since A is double compact relative to Y we must have.

 $(A_1, A_2) \subset (Y \cap (G_{j_1}^1, G_{j_1}^2)) \cup ... \cup (Y \cap (G_{j_n}^1, G_{j_n}^2))...(2)$

Some choice of finitely many indices $j_1,...,j_n$, but (2) implies that $(A_1, A_2) \subset (G_{j1}^1, G_{j1}^2) \cup ... \cup (G_{jn}^1, G_{jn}^2)$ it follows that A is double compact relative to X.

4.5.Proposition. In DTS (X, τ) , double close subsets of compact sets are double compact set .

Proof: Let Y be a double compact subset of a topological space X and let F be a double subset of Y, double closed relative to X. To show that F is double compact. let $C = \{G_j : j \in J\}$ be an open cover of F then the collection $D = \{G_j\} \cup \{X - F\}$ forms an open cover of Y. Since Y compact, there is a finite subcollection D of D which covers Y , and hence covers F. If X-F is member of D we may remove it from D' and still retain an open finite cover of F. Hence F is double compact.

4.6. Definition. A collection C of double set's said to have the double finite intersection property (DIFP) or to be finitely common iff the intersection of members of each finite subcollection of C is non-empty.

4.7. Proposition. Double topological space (X, τ) is double compact iff every collection of double closed subset's of X has a non-empty intersection.

Proof: Let X be double compact set and let $\{F_j = (F_j^1, F_j^2) : j \in J\}$ be collection of double closed set's of X with FIP and suppose if possible $\bigcap \{F_j : j \in J\}$

$$= \bigcap\{(F_j^1, F_j^2) : j \in J\} = \phi = (\phi, X)$$

$$\Rightarrow (\bigcap F_j^1, \bigcup F_j^2) = (\phi, X), \text{ then}$$

$$[\bigcap\{F_j : j \in J\}]'$$

$$= [\bigcap\{(F_j^1, F_j^2) : j \in J\}]' = X = (X, \phi), \text{ or}$$

$$\bigcup \{\overline{F_j} : j \in J\} = \bigcup\{(F_j^2, F_j^1) : j \in J\} = X$$

$$\Rightarrow (\bigcup F_j^2, \bigcap F_j^1) = (\phi, X) \Rightarrow \bigcup\{F_j^2 : j \in J\} = X$$

This means that $\{\overline{F_j} : j \in J\}$ is a double open cover of X. Since F_j 's are DCS's. Since X is double compact set. We have

$$\bigcup \{F_{ji} : i = 1, 2, ..., n\} = X \Longrightarrow$$

$$\left[\bigcap\{F_{ii}: i=1,2,...,n\}\right]' = X$$

Which implies that

 $\bigcap \{F_{ji} : i = 1, 2, ..., n\} = \phi \text{ and this contradicts}$ that FIP of F. Hence we must have $\bigcap \{F_i : j \in J\} \neq \phi.$

Conversely let every collection of DCS's of X with the FIP have non-empty intersection and let $C = \{G_j : j \in J\} = \{(G_j^1, G_j^2) : j \in J\}$ be a double open cover of X so that $X = \bigcup\{(G_j^1, G_j^2) : j \in J\} \Longrightarrow \bigcup\{G_j^1 : j \in J\} = X$

Hence taking complements

$$\phi = [\bigcup \{ (G_j^1, G_j^2) : j \in J \}]' = \bigcap \{ (G_j^2, G_j^1) : j \in J \}$$

thus

 $\{(G_j^2, G_j^1): j \in J\}$ is a collection of DCS's with empty intersection and so by hypothesis this collection does not have the FIP, hence there exists a finite number of G_{ji} , i = 1, 2, ..., n such that $\phi = \bigcap\{(G_{ji}^2, G_{ji}^1): i = 1, 2, ..., n\}$

$$= \bigcup \{ (G_{ji}^1, G_{ji}^2) : i = 1, 2, ..., n \}]$$

 $\Rightarrow X_{i} = \bigcup \{ (G_{ji}^{1}, G_{ji}^{2}) : i = 1, 2, ..., n \} \text{, hence X is}$ double compact.

4.8. Definition. [6] A cover H of bitopological space (X,u,v) is pairwise open if $H \subset u \cup v$ with $H \cap u$ containing a non-empty set and with $H \cap v$ containing a non-empty set.

4.9. Definition. Let A be piarwise open subsets of a topological space X and let

 $C = \{G_j : j \in J\}$ be a collection of pairwise open subsets of X such that

 $A \subset \bigcup \{G_j : j \in J\}$. We then say that C pairwise covers A. By a pairwise sub cover of a pairwise open cover C of A, we mean a pairwise open sub collection C of C such that C pairwise covers A. A pairwise open cover of A is said to be finite if it consists of finite number of pairwise open sets.

4.10. Definition. The DTS (X, τ) is called pairwise compact if every pairwise open cover of X has a finite subcover .

4.12. Proposition. If (X, u, v) is pairwise compact then (X, τ_{uv}) is pairwise compact.

Proof: Let H be pairwise open cover of X and such that H $\bigcap u \neq \phi$ and H $\bigcap v \neq \phi$ and let A, B subset's in X, such that $A \in u$, $B \in v$, since X is pairwise compact then $\{G_j : j \in J\}$, $\{H_j : j \in J\}$ are

respectively an open cover of A, B such that $A \subset \{G_j : j \in J\}$, $B \subset \{H_j : j \in J\}$, there exists a finite sub cover such that $A \subset G_{i1} \bigcup ... \bigcup G_{in}$, $B \subset H_{i1} \bigcup ... \bigcup H_{in}$,

take $U = (A, \phi) \in \tau_{uv}$, $V = (\phi, B^c) \in \tau_{uv}$

Then $U = (A, \phi) \subset (G_{i1}, \phi) \bigcup ... \bigcup (G_{in}, \phi)$ and

$$V = (\phi, B^c) \subset \bigcap (\phi, H^c_i) = (\bigcap \phi, \bigcup H^c_i)$$

so that $H_{j1}^c \bigcup ... \bigcup H_{jn}^c \subset B^c$ then τ_{uv} is pairwise compact.

This suggests the following definition for general double topologies .

.13. Proposition. If (X, τ) is pairwise compact then (X, τ_1, τ_2) is pairwise compact.

Proof: Let A be subset in X, since (X, τ) is pairwise compact then for open cover $\{G_j : j \in J\}$ of $A = (C, D) \in \tau$, there exist a finite open sub cover such that $(C, D) \subset (G_{j1}^1, G_{j1}^2) \cup ... \cup (G_{jn}^1, G_{jn}^2)$ by property $\bigcup A = (\bigcup A_1, \bigcap A_2)$

$$C \subset G_{i1}^1 \cup ... \cup G_{in}^1 \quad , \quad G_{i1}^2 \cap ... \cap G_{in}^2 \subset D$$

So that

 $(G_{i1}^2)^c \bigcup ... \bigcup (G_{in}^2)^c \subset D^c$

$$\therefore (C, D^c) \subset \bigcup \{ (G_j^1, (G_j^2)^c) : j \in J \}$$

 $\therefore (X, \tau_1, \tau_2)$ is pairwise compact . **4.14.** Colloroly. The bitopological space (X, u, v) is pairwise compact iff (X, τ_{uv}) is pairwise compact .

Proof : Necessity follows from proposition 4.12 and sufficiency from proposition 4.13 and 3.4.
